CONCEPTS AND DEFINITIONS

CONSUMER PRICE INDEX (CPI) is an indicator of the change in the average retail prices of a fixed basket goods and services commonly bought by a specific group of consumers for their day-to-day consumption in a given area in a given period of time. It is most widely used in the calculation of the inflation rate and purchasing power of the peso.

The CPI is computed using the weighted arithmetic mean of price relatives, a variant of Laspeyres formula with fixed base year period weights.

- a. *Base Period.* This is a reference date or a benchmark to which a continuous series of index numbers can be related. Since the CPI measure the average changes in the retail prices of a fixed basket of goods, it is necessary to compare movement in prices in the current year to movements in previous years back to a reference data at which the index is taken as equal to 100. The present series uses 2012 as the base year.
- b. *Market Basket.* This is a sample of all the goods purchased for consumption and services availed of by households in the province. This was selected to represent the composite price behavior of all goods and services purchased by consumers.
- c. *Weighting System.* This is a system that considers the relevance of the components of the index. For CPI, the weighting pattern uses the expenditures on various consumer items purchased by households as a proportion to total expenditure. The weight of a commodity or group of commodities was based on the magnitude of its contribution to the index.

CONSUMER PRICE INDEX (CPI) for June 2021 is 133.6. This means that for an average Filipino household to afford same basket of goods and services in June 2012 purchased @ Php 100.00 needs an additional Php 33.60 in June 2021.

BASE PERIOD - reference date at which the index is equal to 100. Base year is 2012.

INFLATION RATE - The inflation rate is the annual rate of change or the year-on-year change of the CPI expressed in percent. It is interpreted in terms of declining purchasing power of money.

If you pay Php 55.00 for a liter of gasoline in June 2020 and if the average prices went up by 6.2% after a year's time, you will need Php 58.41 to pay the same type of gasoline in June 2021.

PURCHASING POWER OF THE PESO (PPP)

The purchasing power of the peso shows how much the peso in the base period is worth in the current period. It is computed as the reciprocal of the CPI for the period under review multiplied by 100.

A peso in June 2012 worths only 75 centavos in June 2021.

Collection of price quotations for the market basket

For Catanduanes, two price quotations for the market basket are collected from the sample outlets (establishments) at the capital, Virac, while four other price quotations are collected from the sample outlets in the municipalities outside Virac during the first five days of the month. However, only two price quotations are collected from Virac during the middle of each month.

For petroleum products, two price quotations for each commodity are collected in Virac every Friday, while four other price quotations for each commodity are collected from the municipalities outside Virac during the first five days of the month.

The arithmetic average of these price quotations is used in the computation of the index.
